      第一步: 创建maven工程jwt_demo并配置pom.xml文件
      第二步: 编写单元测试
   自定义spring boot starter
      开发starter
         第一步: 初始化项目
        第二步:修改pom文件
        第三步:编写实体类|wtUserInfo
         第四步:编写实体类Token
        第五步: 编写工具类RsaKeyHelper
        第六步:编写工具类NumberHelper
        第七步:编写工具类StrHelper
        第八步:编写接口BaseException
         第九步:编写接口BaseExceptionCode
        第十步:编写类BaseUncheckedException
        第十一步:编写类ExceptionCode
        第十二步:编写类BizException
        第十三步:编写常量工具类BaseContextConstants
         第十四步:编写日期工具类DateUtils
        第十五步:编写工具类JwtHelper
        第十六步:编写类AuthClientConfigurationProperties
        第十七步:编写工具类JwtTokenClientUtils
        第十八步:编写配置类AuthClientConfiguration
        第十九步: 编写注解EnableAuthClient
        第二十步: 编写类AuthServerConfigurationProperties
        第二十一步:编写工具类JwtTokenServerUtils
        第二十二步:编写工具类AuthServerConfiguration
        第二十三步:编写注解EnableAuthServer
      使用starter
        第一步: 导入tools-iwt的依赖
        第二步:在资源路径下创建keys目录,将通过RSA算法生成的公钥和私钥复制到此目录下
        第三步:编写application.yml文件
        第四步:在启动类加注解@EnableAuthServer
        第五步:编写UserController
        第六步: 启动服务
        第七步: 访问
```

# jwt

# 认证机制介绍

### **HTTP Basic Auth**

HTTP Basic Auth 是一种简单的登录认证方式,Web浏览器或其他客户端程序在请求时提供用户名和密码,通常用户名和密码会通过HTTP头传递。简单点说就是每次请求时都提供用户的username和 password

这种方式是先把用户名、冒号、密码拼接起来,并将得出的结果字符串用Base64算法编码。

例如,提供的用户名是 bill 、口令是 123456 ,则拼接后的结果就是 bill:123456 ,然后再将其用 Base64编码,得到 YmlsbDoxMjMONTY= 。最终将Base64编码的字符串发送出去,由接收者解码得到一个由冒号分隔的用户名和口令的字符串。

### 优点:

基本上所有流行的网页浏览器都支持基本认证。

#### 缺点:

由于用户名和密码都是Base64编码的,而Base64编码是可逆的,所以用户名和密码可以认为是明文。 所以只有在客户端和服务器主机之间的连接是安全可信的前提下才可以使用。

### **Cookie-Session Auth**

Cookie-session 认证机制是通过浏览器带上来Cookie对象来与服务器端的session对象匹配来实现状态管理。

第一次请求认证在服务端创建一个Session对象,同时在用户的浏览器端创建了一个Cookie对象;当我们关闭浏览器的时候,cookie会被删除。但可以通过修改cookie 的expire time使cookie在一定时间内有效。

#### 优点:

相对HTTP Basic Auth更加安全。

#### 缺点:

这种基于cookie-session的认证使应用本身很难得到扩展,随着不同客户端用户的增加,独立的服务器已无法承载更多的用户,而这时候基于session认证应用的问题就会暴露出来。

### **OAuth**

OAuth 是一个关于授权 (authorization) 的开放网络标准。允许用户提供一个令牌,而不是用户名和密码来访问他们存放在特定服务提供者的数据。现在的版本是2.0版。

严格来说,OAuth2不是一个标准协议,而是一个安全的授权框架。它详细描述了系统中不同角色、用户、服务前端应用(比如API),以及客户端(比如网站或移动App)之间怎么实现相互认证。

### 优点:

- 快速开发,代码量小,维护工作少。
- 如果API要被不同的App使用,并且每个App使用的方式也不一样,使用OAuth2是个不错的选择。

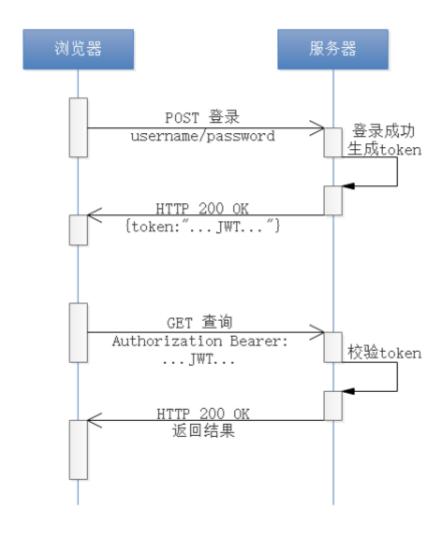

#### 缺点:

OAuth2是一个安全框架,描述了在各种不同场景下,多个应用之间的授权问题。有海量的资料需要学习,要完全理解需要花费大量时间。OAuth2不是一个严格的标准协议,因此在实施过程中更容易出错。

### **Token Auth**

基于token的认证鉴权机制类似于http协议,也是无状态的。这种方式不需要在服务端去保留用户的认证信息或者会话信息。这就意味着基于token认证机制的应用不需要去考虑用户在哪一台服务器登录了,这就为应用的扩展提供了便利。

这个token必须要在每次请求时传递给服务端,它应该保存在请求头中,Token Auth 流程如下图:

#### 优点:

- 支持跨域访问
- Token机制在服务端不需要存储session信息: Token 自身包含了所有登录用户的信息,只需要在客户端的cookie或本地介质存储状态信息
- 去耦:不需要绑定到一个特定的身份验证方案。Token可以在任何地方生成,只要在你的API被调用的时候,你可以进行Token生成调用即可
- 更适用于移动应用: Cookie是不被客户端 (iOS, Android, Windows 8等) 支持的。
- 基于标准化:

API可以采用标准化的 JSON Web Token (JWT)。这个标准已经存在多个后端库(.NET, Ruby, Java,Python, PHP)和多家公司的支持(如:Firebase,Google, Microsoft)

#### 缺点:

- 占带宽
  - 正常情况下要比 session\_id 更大,需要消耗更多流量,挤占更多带宽,假如你的网站每月有 10 万次的浏览器,就意味着要多开销几十兆的流量。听起来并不多,但日积月累也是不小一笔开销。实际上,许多人会在 JWT 中存储的信息会更多
- 无法在服务端注销,因为服务端是无状态的,并没有保存客户端用户登录信息
- 对于有着严格性能要求的 Web 应用并不理想, 尤其对于单线程环境

# JWT介绍

JWT全称为JSON Web Token,是目前最流行的跨域身份验证解决方案。JWT是为了在网络应用环境间传递声明而制定的一种基于JSON的开放标准。

JWT特别适用于分布式站点的单点登录(SSO)场景。JWT的声明一般被用来在身份提供者和服务提供者间传递被认证的用户身份信息,以便于从资源服务器获取资源,也可被加密。

## JWT的数据结构

WT其实就是一个很长的字符串,字符之间通过"."分隔符分为三个子串,各字串之间没有换行符。每一个子串表示了一个功能块,总共有三个部分: **JWT头**(header)、**有效载荷(payload)**、**签名(signature)**, 如下图所示:

# JWT TOKEN

## JWT头

JWT头是一个描述JWT元数据的JSON对象,通常如下所示:

```
1 | {"alg": "HS256","typ": "JWT"}
```

alg:表示签名使用的算法,默认为HMAC SHA256 (写为HS256)

typ:表示令牌的类型,JWT令牌统一写为JWT

最后,使用Base64 URL算法将上述JSON对象转换为字符串

# 有效载荷

有效载荷,是JWT的主体内容部分,也是一个JSON对象,包含需要传递的数据。

有效载荷部分规定有如下七个默认字段供选择:

```
1 iss: 发行人
2 exp: 到期时间
3 sub: 主题
4 aud: 用户
5 nbf: 在此之前不可用
6 iat: 发布时间
7 jti: JWT ID用于标识该JWT
```

除以上默认字段外, 还可以自定义私有字段。

最后,同样使用Base64 URL算法将有效载荷部分JSON对象转换为字符串

### 签名

签名实际上是一个加密的过程,是对上面两部分数据通过指定的算法生成哈希,以确保数据不会被篡改。

首先需要指定一个密码(secret),该密码仅仅保存在服务器中,并且不能向用户公开。然后使用JWT头中指定的签名算法(默认情况下为HMAC SHA256),根据以下公式生成签名哈希:

```
1 HMACSHA256(base64UrlEncode(header) + "." + base64UrlEncode(payload), secret)
```

在计算出签名哈希后,JWT头,有效载荷和签名哈希的三个部分组合成一个字符串,每个部分用"."分隔,就构成整个JWT对象

# JWT签名算法

JWT签名算法中,一般有两个选择: HS256和RS256。

HS256 (带有 SHA-256 的 HMAC )是一种对称加密算法, 双方之间仅共享一个密钥。由于使用相同的密钥生成签名和验证签名, 因此必须注意确保密钥不被泄密。

RS256 (采用SHA-256 的 RSA 签名) 是一种非对称加密算法, 它使用公共/私钥对: JWT的提供方采用私钥生成签名, JWT 的使用方获取公钥以验证签名。

# jjwt介绍

jjwt是一个提供JWT创建和验证的Java库。永远免费和开源(Apache License,版本2.0),JJWT很容易使用和理解。

jjwt的maven坐标:

## 第一步: 创建maven工程jwt\_demo并配置pom.xml文件

```
<?xml version="1.0" encoding="UTF-8"?>
 2
    project xmlns="http://maven.apache.org/POM/4.0.0"
             xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
 3
 4
             xsi:schemaLocation="http://maven.apache.org/POM/4.0.0
    http://maven.apache.org/xsd/maven-4.0.0.xsd">
 5
        <modelVersion>4.0.0</modelVersion>
        <!--
 6
 7

```

## 第二步:编写单元测试

```
1
 2
     * 生成token,不使用签名
 3
     */
 4
    @Test
 5
    void test1()
 6
 7
        Map<String, Object> head = new HashMap<>();
        head.put("alg", "none");
 8
 9
        head.put("typ", "JWT");
10
11
        Map<String, Object> body = new HashMap<>();
12
        body.put("userId", "10001");
        body.put("username", "张三");
13
        body.put("sex", "男");
14
15
16
        String token = Jwts.builder()
```

```
1 /**
2
    *解析token,不使用签名
 3
    */
 4
  @Test
 5 void test2()
 6
 7
        Jwt jwt = Jwts.parser().parse("eyJ0eXAi0iJKV1QiLCJhbGci0iJub251In0." +
8
     "eyJzZXgiOiLnlLciLCJ1c2VySWQiOiIxMDAwMSIsImpOaSI6Imp3dDEiLCJ1c2VybmFtZSI6Iu
    W8oOS4iSJ9.");
9
        Header header = jwt.getHeader();
10
        Object body = jwt.getBody();
11
        System.out.println(jwt);
12
        System.out.println(header);
13
        System.out.println(body);
14
    }
```

```
b. (User's (mad (. ) uks (open) uk-10.0.2 (blin () ava.exe ... header={typ=JWT, alg=none}, body={sex=男, userId=10001, jti=jwt1, username=张三} {typ=JWT, alg=none} {sex=男, userId=10001, jti=jwt1, username=张三} 进程已结束,退出代码为 0
```

```
1 /**
 2
     * 生成token,使用hs256签名算法
 3
     */
 4
    @Test
 5
    void test3()
 6
 7
        Map<String, Object> head = new HashMap<>();
8
        head.put("alg", SignatureAlgorithm.HS256.getValue());
9
        head.put("typ", "JWT");
10
11
        Map<String, Object> body = new HashMap<>();
        body.put("userId", "10002");
12
        body.put("username", "张三");
13
        body.put("sex", "男");
14
15
16
        String token = Jwts.builder()
17
                .setHeader(head)
18
                .setClaims(body)
19
                .setId("jwt2")
20
                .signWith(SignatureAlgorithm.HS256, "123456")
21

# 自定义spring boot starter

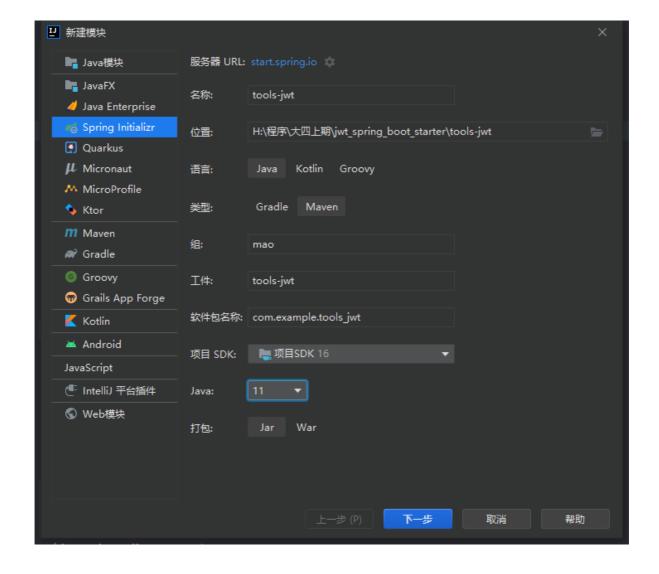

### 开发starter

## 第一步: 初始化项目

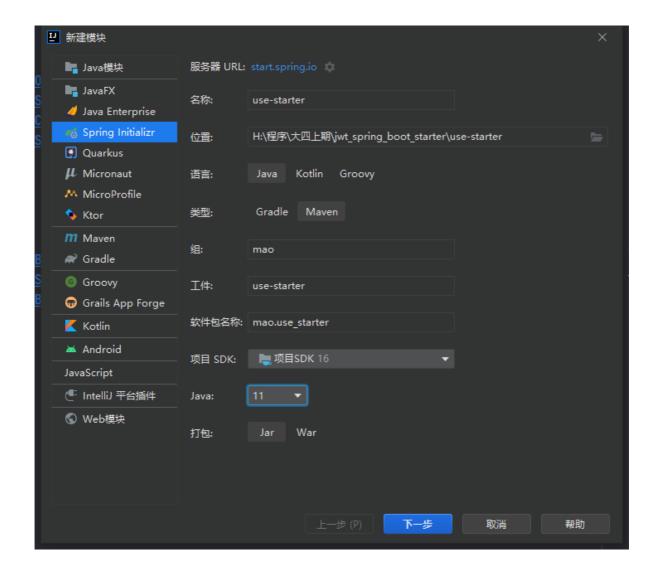

创建父工程jwt\_spring\_boot\_starter

创建子工程tools-jwt

创建子工程use-starter

## 第二步:修改pom文件

父工程jwt\_spring\_boot\_starter的pom文件:

```
<?xml version="1.0" encoding="UTF-8"?>
1
    project xmlns="http://maven.apache.org/POM/4.0.0"
    xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
3
             xsi:schemaLocation="http://maven.apache.org/POM/4.0.0"
    https://maven.apache.org/xsd/maven-4.0.0.xsd">
        <modelversion>4.0.0</modelversion>
4
5
6
        <parent>
7
            <groupId>org.springframework.boot</groupId>
            <artifactId>spring-boot-starter-parent</artifactId>
8
9
            <version>2.7.1
            <relativePath/> <!-- lookup parent from repository -->
10
11
        </parent>
12
        <groupId>mao</groupId>
13
        <artifactId>jwt_spring_boot_starter</artifactId>
14
        <version>0.0.1-SNAPSHOT
15
```

```
16
        <name>jwt_spring_boot_starter</name>
17
         <description>jwt_spring_boot_starter</description>
18
        <packaging>pom</packaging>
19
20
        cproperties>
21
             <java.version>11</java.version>
22
        </properties>
23
24
        <modules>
25
             <module>tools-jwt</module>
             <module>use-starter</module>
26
27
        </modules>
28
29
        <dependencies>
30
31
        </dependencies>
32
33
        <dependencyManagement>
             <dependencies>
34
35
             </dependencies>
36
37
        </dependencyManagement>
38
39
    </project>
```

### 子工程tools-jwt的pom文件:

```
<?xml version="1.0" encoding="UTF-8"?>
    project xmlns="http://maven.apache.org/POM/4.0.0"
 2
    xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
 3
             xsi:schemaLocation="http://maven.apache.org/POM/4.0.0
    https://maven.apache.org/xsd/maven-4.0.0.xsd">
        <modelversion>4.0.0</modelversion>
 4
 5
 6
        <parent>

                <groupId>org.springframework.boot</groupId>
28
29
                <artifactId>spring-boot-starter-test</artifactId>
30
                <scope>test</scope>
31
            </dependency>
```

```
32
33
        </dependencies>
34
        <build>
35
36
            <plugins>
37
                <plugin>
38
                     <groupId>org.springframework.boot</groupId>
                     <artifactId>spring-boot-maven-plugin</artifactId>
39
40
                </plugin>
41
            </plugins>
42
        </build>
43
44 </project>
```

### 第三步:编写实体类JwtUserInfo

```
1
    package com.example.tools_jwt.entity;
2
3
   import java.io.Serializable;
4
   /**
5
    * Project name(项目名称): jwt_spring_boot_starter
6
    * Package(包名): com.example.tools_jwt.entity
    * Class(类名): JwtUserInfo
8
    * Author(作者): mao
9
10
    * Author QQ: 1296193245
    * GitHub: https://github.com/maomao124/
11
12
    * Date(创建日期): 2022/11/2
    * Time(创建时间): 22:12
13
14
    * Version(版本): 1.0
15
    * Description(描述): 无
16
    */
17
18
    public class JwtUserInfo implements Serializable
19
20
   {
       /**
21
        * 账号id
22
23
        */
24
        private Long userId;
       /**
25
        * 账号
26
        */
27
28
       private String account;
       /**
29
        * 姓名
30
        */
31
32
        private String name;
33
34
        /**
```

```
35
     * 当前登录人单位id
36
        */
37
        private Long orgId;
38
        /**
39
        * 当前登录人岗位ID
40
        */
41
        private Long stationId;
42
43
44
45
        * Instantiates a new Jwt user info.
        */
46
        public JwtUserInfo()
47
48
        {
49
50
        }
51
52
        /**
53
        * Instantiates a new Jwt user info.
54
55
        * @param userId the user id
56
         * @param account the account
                          the name
57
         * @param name
58
         * @param orgId
                          the org id
59
         * @param stationId the station id
60
         */
61
        public JwtUserInfo(Long userId, String account, String name, Long
    orgId, Long stationId)
62
        {
63
            this.userId = userId;
64
            this.account = account;

        public String getName()
116
117
           return name;
118
         }
119
120
        /**
121
         * Sets name.
122
123
         * @param name the name
124
125
         public void setName(String name)
126
127
            this.name = name;
128
         }
129
        /**
130
131
         * Gets org id.
132
         * @return the org id
133
         */
134
135
         public Long getOrgId()
136
137
            return orgId;
138
         }
139
        /**
140
         * Sets org id.
141
142
143
         * @param orgId the org id
         */
144
145
         public void setOrgId(Long orgId)
146
147
            this.orgId = orgId;
148
         }
149
```

```
150
          * Gets station id.
151
152
153
          * @return the station id
154
155
         public Long getStationId()
156
         {
157
             return stationId;
158
         }
159
         /**
160
161
          * Sets station id.
162
163
          * @param stationId the station id
164
165
         public void setStationId(Long stationId)
166
         {
167
             this.stationId = stationId;
168
         }
169
         @override
170
         public String toString()
171
172
         {
             final StringBuffer sb = new StringBuffer("JwtUserInfo{");
173
174
             sb.append("userId=").append(userId);
             sb.append(", account='").append(account).append('\'');
175
             sb.append(", name='").append(name).append('\'');
176
             sb.append(", orgId=").append(orgId);
177
             sb.append(", stationId=").append(stationId);
178
179
             sb.append('}');
180
             return sb.toString();
181
         }
182
    }
```

### 第四步:编写实体类Token

```
package com.example.tools_jwt.entity;
1
 2
 3
    import io.swagger.annotations.ApiModelProperty;
 4
5
    import java.io.Serializable;
6
 7
     * Project name(项目名称): jwt_spring_boot_starter
8
9
     * Package(包名): com.example.tools_jwt.entity
     * Class(类名): Token
10
11
    * Author(作者): mao
     * Author QQ: 1296193245
12
13
     * GitHub: https://github.com/maomao124/
     * Date(创建日期): 2022/11/2
14
     * Time(创建时间): 22:15
15
```

```
16 * Version(版本): 1.0
17
     * Description(描述): 无
18
    public class Token implements Serializable
19
20
21
        private static final long serialVersionUID = -8482946147572784305L;
22
        /**
23
24
         * token
         */
25
        @ApiModelProperty(value = "token")
26
27
        private String token;
28
29
         * 有效时间: 单位: 秒
        */
30
        @ApiModelProperty(value = "token的有效期")
31
32
        private Integer expire;
33
34
        /**
        * Instantiates a new Token.
35
         */
36
37
        public Token()
38
        {
39
40
        }
41
42
        /**
43
         * Instantiates a new Token.
44
45
         * @param token the token
         * @param expire the expire
46
         */
47
48
        public Token(String token, Integer expire)
49
        {
50
            this.token = token;
51
            this.expire = expire;
52
        }
53
        /**
54
55
         * Gets token.
56
         * @return the token
57
         */
58
59
        public String getToken()
60
        {
            return token;
61
62
        }
63
        /**
64
65
         * Sets token.
66
67
         * @param token the token
         */
68
        public void setToken(String token)
69
70
        {
71
            this.token = token;
72
        }
73
```

```
74
         * Gets expire.
75
76
77
         * @return the expire
78
        public Integer getExpire()
79
80
81
            return expire;
82
        }
83
        /**
84
85
         * Sets expire.
86
87
        * @param expire the expire
88
        public void setExpire(Integer expire)
89
90
91
            this.expire = expire;
92
        }
93 }
```

## 第五步: 编写工具类RsaKeyHelper

```
package com.example.tools_jwt.utils;
2
 3
    import java.io.DataInputStream;
 4
   import java.io.IOException;
    import java.io.InputStream;
    import java.security.KeyFactory;
 6
7
    import java.security.NoSuchAlgorithmException;
8
    import java.security.PrivateKey;
    import java.security.PublicKey;
9
10
    import java.security.spec.InvalidKeySpecException;
    import java.security.spec.PKCS8EncodedKeySpec;
11
12
    import java.security.spec.X509EncodedKeySpec;
13
    /**
14
15
    * Project name(项目名称): jwt_spring_boot_starter
    * Package(包名): com.example.tools_jwt.utils
16
17
    * Class(类名): RsaKeyHelper
18
     * Author(作者): mao
19
    * Author QQ: 1296193245
20
    * GitHub: https://github.com/maomao124/
21
    * Date(创建日期): 2022/11/2
    * Time(创建时间): 22:19
22
23
     * Version(版本): 1.0
24
    * Description(描述): Rsa key 帮助类
25
26
27
    public class RsaKeyHelper
28
```

```
29
30
         * 获取公钥,用于解析token
31
32
33
         * @param filename 文件名
34
         * @return {@link PublicKey}
35
         * @throws IOException
                                           ioexception
36
         * @throws NoSuchAlgorithmException 没有这样算法异常
         * @throws InvalidKeySpecException 无效关键规范异常
37
38
39
        public PublicKey getPublicKey(String filename) throws IOException,
    NoSuchAlgorithmException, InvalidKeySpecException
40
            InputStream inputStream =
41
    this.getClass().getClassLoader().getResourceAsStream(filename);
            if (inputStream == null)
42
43
            {
                throw new IOException("获取公钥时获取失败,可能是公钥文件不存在。当前路
44
    径: " + filename);
45
46
            try (DataInputStream dataInputStream = new
    DataInputStream(inputStream))
47
            {
                byte[] keyBytes = new byte[inputStream.available()];
48
49
                dataInputStream.readFully(keyBytes);
                X509EncodedKeySpec X509EncodedKeySpec = new

                byte[] keyBytes = new byte[inputStream.available()];
77
                dataInputStream.readFully(keyBytes);
```

```
PKCS8EncodedKeySpec pkcs8EncodedKeySpec = new

PKCS8EncodedKeySpec(keyBytes);

KeyFactory keyFactory = KeyFactory.getInstance("RSA");

return keyFactory.generatePrivate(pkcs8EncodedKeySpec);

return keyFactory.generatePrivate(pkcs8EncodedKeySpec);

}
```

## 第六步: 编写工具类NumberHelper

```
package com.example.tools_jwt.utils;
 2
 3
    import java.util.function.Function;
 4
 5
    /**
 6
    * Project name(项目名称): jwt_spring_boot_starter
 7
    * Package(包名): com.example.tools_jwt.utils
 8
     * Class(类名): NumberHelper
 9
    * Author(作者): mao
     * Author QQ: 1296193245
10
11
    * GitHub: https://github.com/maomao124/
    * Date(创建日期): 2022/11/2
12
     * Time(创建时间): 22:27
13
14
     * Version(版本): 1.0
     * Description(描述): 无
15
16
     */
17
18
    public class NumberHelper
19
        private static <T, R> R valueOfDef(T t, Function<T, R> function, R def)
20
21
        {
22
            try
23
            {
24
                return function.apply(t);
25
26
            catch (Exception e)
27
28
                return def;
29
            }
30
        }
31
32
        public static Long longValueOfNil(String value)
33
        {
34
            return valueOfDef(value, (val) -> Long.valueOf(val), null);
35
        }
36
        public static Long longValueOfO(String value)
37
38
        {
            return valueOfDef(value, (val) -> Long.valueOf(val), 0L);
39
40
        }
```

```
41
42
        public static Long longValueOfNil(Object value)
43
44
            return valueOfDef(value, (val) -> Long.valueOf(val.toString()),
    null);
45
        }
46
        public static Long longValueOfO(Object value)
47
48
49
            return valueOfDef(value, (val) -> Long.valueOf(val.toString()), 0L);
50
        }
51
        public static Boolean boolValueOfO(Object value)
52
53
54
            return valueOfDef(value, (val) -> Boolean.valueOf(val.toString()),
    false);
55
        }
56
        public static Integer intValueOfNil(String value)
57
58
            return valueOfDef(value, (val) -> Integer.valueOf(val), null);
59
60
        }
61
        public static Integer intValueOfO(String value)
62
63
64
            return intValueOf(value, 0);
65
        }
66
        public static Integer intValueOf(String value, Integer def)
67
68
69
            return valueOfDef(value, (val) -> Integer.valueOf(val), def);
70
        }
71
72
        public static Integer intValueOfNil(Object value)
73
74
            return valueOfDef(value, (val) -> Integer.valueOf(val.toString()),
    null);
75
        }
76
77
        public static Integer intValueOfO(Object value)
78
79
            return valueOfDef(value, (val) -> Integer.valueOf(val.toString()),
    0);
80
        }
81
        public static Integer getOrDef(Integer val, Integer def)
82
83
84
            return val == null ? def : val;
85
        }
86
87
        public static Long getOrDef(Long val, Long def)
88
            return val == null ? def : val;
89
90
91
92
        public static Boolean getOrDef(Boolean val, Boolean def)
93
        {
            return val == null ? def : val;
94
```

```
95 | }
96 | }
```

## 第七步:编写工具类StrHelper

```
package com.example.tools_jwt.utils;
 2
 3
    import cn.hutool.core.util.StrUtil;
 4
 5
    import java.net.URLDecoder;
 6
    import java.net.URLEncoder;
 7
    import java.nio.charset.StandardCharsets;
 8
 9
    /**
10
    * Project name(项目名称): jwt_spring_boot_starter
11
     * Package(包名): com.example.tools_jwt.utils
12
     * Class(类名): StrHelper
13
    * Author(作者): mao
     * Author QQ: 1296193245
14
15
     * GitHub: https://github.com/maomao124/
     * Date(创建日期): 2022/11/2
16
17
     * Time(创建时间): 22:28
    * Version(版本): 1.0
18
19
     * Description(描述): 无
20
21
22
    public class StrHelper
23
        public static String getObjectValue(Object obj)
24
25
            return obj == null ? "" : obj.toString();
26
        }
27
28
        public static String encode(String value)
29
30
31
            try
32
            {
33
                return URLEncoder.encode(value, StandardCharsets.UTF_8);
34
            }
35
            catch (Exception e)
36
            {
37
                return "";
38
            }
39
        }
40
        public static String decode(String value)
41
42
        {
43
            try
44
            {
                return URLDecoder.decode(value, StandardCharsets.UTF_8);
45
46
            }
```

```
47
       catch (Exception e)
48
           {
               return "";
49
50
           }
       }
51
52
53
       public static String getOrDef(String val, String def)
54
          return StrUtil.isEmpty(val) ? def : val;
55
56
       }
57 }
```

## 第八步:编写接口BaseException

```
package com.example.tools_jwt.exception;
2
3 /**
   * 异常接口类
4
   */
6 public interface BaseException
7
8
     /**
9
10
       * 统一参数验证异常码
       */
11
12
      int BASE_VALID_PARAM = -9;
13
      /**
14
15
       * 返回异常信息
16
       * @return {@link String}
17
       */
18
19
      String getMessage();
20
       /**
21
22
       * 返回异常编码
23
24
       * @return int
25
       */
      int getCode();
26
27
28 }
```

## 第九步:编写接口BaseExceptionCode

```
package com.example.tools_jwt.exception;
2
3 /**
4
    * Project name(项目名称): jwt_spring_boot_starter
   * Package(包名): com.example.tools_jwt.exception
    * Interface(接口名): BaseExceptionCode
7
    * Author(作者): mao
8
    * Author QQ: 1296193245
9
    * GitHub: https://github.com/maomao124/
10
   * Date(创建日期): 2022/11/2
    * Time(创建时间): 22:32
11
12
    * Version(版本): 1.0
13
   * Description(描述): 无
14
15
16
   public interface BaseExceptionCode
17 {
      /**
18
19
       * 异常编码
20
       * @return int
21
       */
22
23
      int getCode();
24
      /**
25
       * 异常消息
26
27
       * @return String
28
29
       */
30
       String getMsg();
31 }
```

# 第十步:编写类BaseUncheckedException

```
1
   package com.example.tools_jwt.exception;
2
   /**
3
4
    * 非运行期异常基类,所有自定义非运行时异常继承该类
  public class BaseUncheckedException extends RuntimeException implements
   BaseException
7
8
9
       private static final long serialVersionUID = -778887391066124051L;
10
       /**
11
12
        * 异常信息
```

```
13
14
        protected String message;
15
        /**
16
         * 具体异常码
17
         */
18
19
        protected int code;
20
21
        public BaseUncheckedException(int code, String message)
22
23
            super(message);
24
            this.code = code;
25
            this.message = message;
26
        }
27
        public BaseUncheckedException(int code, String format, Object... args)
28
29
        {
30
            super(String.format(format, args));
            this.code = code;
31
32
            this.message = String.format(format, args);
33
        }
34
35
        @override
36
37
        public String getMessage()
38
39
            return message;
40
        }
41
42
        @override
        public int getCode()
43
44
45
            return code;
46
        }
47
    }
```

## 第十一步:编写类ExceptionCode

```
package com.example.tools_jwt.exception;
1
2
   /**
3
4
   * 全局错误码 10000-15000
   * 
6
   * 预警异常编码 范围: 30000~34999
   * 标准服务异常编码 范围: 35000~39999
8
   * 邮件服务异常编码 范围: 40000~44999
9
   * 短信服务异常编码 范围: 45000~49999
   * 权限服务异常编码 范围: 50000-59999
10
11
   * 文件服务异常编码 范围: 60000~64999
   * 日志服务异常编码 范围: 65000~69999
12
    * 消息服务异常编码 范围: 70000~74999
13
```

```
14
    * 开发者平台异常编码 范围: 75000~79999
15
    * 搜索服务异常编码 范围: 80000-84999
    * 共享交换异常编码 范围: 85000-89999
16
17
    * 移动终端平台 异常码 范围: 90000-94999
    * 
18
19
    * 安全保障平台 范围:
                              95000-99999
    * 软硬件平台 异常编码 范围: 100000-104999
20
21
    * 运维服务平台 异常编码 范围: 105000-109999
    * 统一监管平台异常 编码 范围: 110000-114999
22
23
    * 认证方面的异常编码 范围: 115000-115999
24
    */
25
26
    public enum ExceptionCode implements BaseExceptionCode
27
28
29
       //系统相关 start
30
       SUCCESS(0, "成功"),
31
       SYSTEM_BUSY(-1, "系统繁忙~请稍后再试~"),

 73
         JWT_USER_ENABLED(40007, "用户已经被禁用!"),
 74
 75
         //jwt token 相关 end
 76
 77
 78
 79
         private int code;
         private String msg;
 80
 81
         ExceptionCode(int code, String msg)
 82
 83
         {
             this.code = code;
 84
 85
             this.msg = msg;
 86
         }
 87
 88
         @override
 89
         public int getCode()
 90
 91
             return code;
 92
         }
 93
 94
         @override
 95
         public String getMsg()
 96
         {
 97
             return msg;
         }
 98
 99
100
101
         public ExceptionCode build(String msg, Object... param)
102
         {
103
             this.msg = String.format(msg, param);
104
             return this;

         public ExceptionCode param(Object... param)
107
108
109
             msg = String.format(msg, param);
110
             return this;
111
112
    }
```

# 第十二步:编写类BizException

```
package com.example.tools_jwt.exception;

/**

* 业务异常

* 用于在处理业务逻辑时,进行抛出的异常。
```

```
6
 7
    public class BizException extends BaseUncheckedException
 8
    {
9
10
        private static final long serialVersionUID = -3843907364558373817L;
11
12
        public BizException(String message)
13
            super(-1, message);
14
15
        }
16
17
        public BizException(int code, String message)
18
            super(code, message);
19
20
        }
21
22
        public BizException(int code, String message, Object... args)
23
            super(code, message, args);
24
25
        }
26
27
        /**
28
         * 实例化异常
29
30
         * @param code 自定义异常编码
31
         * @param message 自定义异常消息
32
         * @param args 已定义异常参数
         * @return
33
         */
34
35
        public static BizException wrap(int code, String message, Object...
    args)
36
        {
            return new BizException(code, message, args);
37
38
        }
39
        public static BizException wrap(String message, Object... args)
40
41
42
            return new BizException(-1, message, args);
        }
43
44
        public static BizException validFail(String message, Object... args)
45
46
47
            return new BizException(-9, message, args);
48
        }
49
50
        public static BizException wrap(BaseExceptionCode ex)
51
52
            return new BizException(ex.getCode(), ex.getMsg());
53
        }
54
        @override
55
56
        public String toString()
57
            return "BizException [message=" + message + ", code=" + code + "]";
58
59
        }
60
61
    }
```

#### 第十三步: 编写常量工具类BaseContextConstants

```
package com.itheima.pinda.context;
2
3
    /**
4
    * 常量工具类
6
    */
7
   public class BaseContextConstants {
8
9
        *
       */
10
11
       public static final String TOKEN_NAME = "token";
       /**
12
13
14
        */
15
       public static final String JWT_KEY_USER_ID = "userid";
       /**
16
        *
17
18
        */
19
       public static final String JWT_KEY_NAME = "name";
20
        /**
        *
21
        */
22
23
       public static final String JWT_KEY_ACCOUNT = "account";
24
        /**
25
26
        * 组织id
27
28
       public static final String JWT_KEY_ORG_ID = "orgid";
       /**
29
        * 岗位id
30
31
        */
32
       public static final String JWT_KEY_STATION_ID = "stationid";
33
       /**
34
35
        * 动态数据库名前缀。 每个项目配置死的
36
37
       public static final String DATABASE_NAME = "database_name";
38 }
```

## 第十四步:编写日期工具类DateUtils

```
1
    package com.example.tools_jwt.utils;
2
3
   import com.example.tools_jwt.exception.BizException;
    import org.slf4j.Logger;

## 第十六步:编写类AuthClientConfigurationProperties

```
package com.example.tools_jwt.client.config;

import org.springframework.boot.context.properties.ConfigurationProperties;

import static
com.example.tools_jwt.client.config.AuthClientConfigurationProperties.PREFIX;

/**

* Project name(项目名称): jwt_spring_boot_starter

* Package(包名): com.example.tools_jwt.client.config
```

```
10
    * Class(类名): AuthClientConfigurationProperties
11
     * Author(作者): mao
12
     * Author QQ: 1296193245
13
     * GitHub: https://github.com/maomao124/
    * Date(创建日期): 2022/11/3
14
15
     * Time(创建时间): 12:42
16
     * Version(版本): 1.0
17
     * Description(描述): 无
18
     */
19
    @ConfigurationProperties(prefix = PREFIX)
20
21
    public class AuthClientConfigurationProperties
22
    {
23
        public static final String PREFIX = "authentication";
24
25
        private TokenInfo user;
26
27
        public AuthClientConfigurationProperties()
28
        {
29
30
        }
31
32
        public TokenInfo getUser()
33
34
            return user;
35
        }
36
        public void setUser(TokenInfo user)
37
38
        {
39
            this.user = user;
40
        }
41
        public static class TokenInfo
42
43
        {
44
            /**
45
             * 请求头名称
             */
46
47
            private String headerName;
            /**
48
49
             * 解密 网关使用
50
             */
51
            private String pubKey;
52
            public TokenInfo()
53
54
            {
55
56
            }
57
            public TokenInfo(String headerName, String pubKey)
58
59
            {
                this.headerName = headerName;
60
61
                this.pubKey = pubKey;
62
            }
63
            public String getHeaderName()
64
65
            {
66
                return headerName;
67
            }
```

```
68
69
            public void setHeaderName(String headerName)
70
            {
71
                 this.headerName = headerName;
72
            }
73
74
            public String getPubKey()
75
            {
76
                 return pubKey;
77
78
79
            public void setPubKey(String pubKey)
80
            {
                 this.pubKey = pubKey;
81
82
            }
83
        }
    }
84
```

## 第十七步:编写工具类JwtTokenClientUtils

```
package com.example.tools_jwt.client.utils;
2
 3
   import
    com.example.tools_jwt.client.config.AuthClientConfigurationProperties;
    import com.example.tools_jwt.entity.JwtUserInfo;
 5
    import com.example.tools_jwt.exception.BizException;
6
    import com.example.tools_jwt.utils.JwtHelper;
 7
    /**
8
9
    * Project name(项目名称): jwt_spring_boot_starter
    * Package(包名): com.example.tools_jwt.client.utils
10
11
    * Class(类名): JwtTokenClientUtils
12
    * Author(作者): mao
13
    * Author QQ: 1296193245
14
    * GitHub: https://github.com/maomao124/
15
    * Date(创建日期): 2022/11/3
    * Time(创建时间): 12:45
16
17
    * Version(版本): 1.0
18
    * Description(描述): 无
19
20
    public class JwtTokenClientUtils
21
22
       /**
23
       * 用于 认证服务的 客户端使用(如 网关), 在网关获取到token后,
24
        * 调用此工具类进行token 解析。
25
26
       * 客户端一般只需要解析token 即可
27
        private final AuthClientConfigurationProperties
28
    authClientConfigurationProperties;
```

```
29
30
        public JwtTokenClientUtils(AuthClientConfigurationProperties
    authClientConfigurationProperties)
31
32
            this.authClientConfigurationProperties =
    authClientConfigurationProperties;
33
        }
34
       /**
35
36
        * 解析token,获取用户信息
37
38
        * @param token 令牌
39
        * @return {@link JwtUserInfo}
        * @throws BizException 业务异常
40
41
        public JwtUserInfo getUserInfo(String token) throws BizException
42
43
44
            AuthClientConfigurationProperties.TokenInfo userTokenInfo =
    authClientConfigurationProperties.getUser();
            return JwtHelper.getJwtFromToken(token, userTokenInfo.getPubKey());
45
        }
46
    }
47
```

## 第十八步:编写配置类AuthClientConfiguration

```
package com.example.tools_jwt.client.config;
 2
 3
   import com.example.tools_jwt.client.utils.JwtTokenClientUtils;
    import org.springframework.beans.factory.annotation.Autowired;
 4
    import
    org.springframework.boot.context.properties.EnableConfigurationProperties;
    import org.springframework.context.annotation.Bean;
 6
 7
    /**
8
    * Project name(项目名称): jwt_spring_boot_starter
9
     * Package(包名): com.example.tools_jwt.client.config
10
11
    * Class(类名): AuthClientConfiguration
    * Author(作者): mao
12
13
    * Author QQ: 1296193245
    * GitHub: https://github.com/maomao124/
14
     * Date(创建日期): 2022/11/3
15
16
    * Time(创建时间): 12:49
    * Version(版本): 1.0
17
18
     * Description(描述): 无
19
20
21
    @EnableConfigurationProperties(AuthClientConfigurationProperties.class)
    public class AuthClientConfiguration
22
23
    {
24
        @Bean
```

```
public JwtTokenClientUtils jwtTokenClientUtils(@Autowired
AuthClientConfigurationProperties authClientConfigurationProperties)

{
    return new JwtTokenClientUtils(authClientConfigurationProperties);
}

}
```

## 第十九步:编写注解EnableAuthClient

```
package com.example.tools_jwt.client;
2
 3
    import com.example.tools_jwt.client.config.AuthClientConfiguration;
4
5
    import org.springframework.context.annotation.Import;
6
7
    import java.lang.annotation.*;
8
9
    @Target(ElementType.TYPE)
    @Retention(RetentionPolicy.RUNTIME)
10
11
    @Documented
12
    @Inherited
13
    @Import(AuthClientConfiguration.class)
    public @interface EnableAuthClient
14
15
    {
16
17
18
   配置文件示例:
19
20
21 authentication:
    user:
22
23
       # 过期时间
24
       expire: 1800
25
       # 公钥位置
26
        pubKey: keys/pub.key
27
     */
28
29
    }
30
```

## 第二十步:编写类AuthServerConfigurationProperties

```
package com.example.tools_jwt.server.config;
 1
 2
 3
   import org.springframework.boot.context.properties.ConfigurationProperties;
 4
   /**
 5
    * Project name(项目名称): jwt_spring_boot_starter
 6
 7
    * Package(包名): com.example.tools_jwt.server.config
 8
    * Class(类名): AuthServerConfigurationProperties
 9
    * Author(作者): mao
10
    * Author QQ: 1296193245
    * GitHub: https://github.com/maomao124/
11
12
    * Date(创建日期): 2022/11/3
13
    * Time(创建时间): 12:55
14
    * Version(版本): 1.0
15
    * Description(描述): 无
    */
16
17
    @ConfigurationProperties(prefix = AuthServerConfigurationProperties.PREFIX)
18
19
    public class AuthServerConfigurationProperties
20
        public static final String PREFIX = "authentication";
21
22
23
        private TokenInfo user;
24
25
        public AuthServerConfigurationProperties()
26
        {
27
28
        }
29
        public AuthServerConfigurationProperties(TokenInfo user)
30
31
        {
32
            this.user = user;
33
        }
34
35
        public TokenInfo getUser()
36
        {
37
           return user;
38
        }
39
40
        public void setUser(TokenInfo user)
41
        {
42
            this.user = user;
        }
43
44
        public static class TokenInfo
45
46
        {
            /**
47
            * 过期时间
48
            */
49
50
            private Integer expire = 7200;
51
52
            * 加密 服务使用
53
```

```
54
             private String priKey;
 55
              /**
              * 解密
 56
 57
              */
 58
              private String pubKey;
 59
 60
             public TokenInfo()
 61
              {
 62
             }
 63
 64
 65
             public TokenInfo(Integer expire, String priKey, String pubKey)
 66
 67
                  this.expire = expire;
                  this.priKey = priKey;
 68
 69
                  this.pubKey = pubKey;
 70
             }
 71
 72
             public Integer getExpire()
 73
 74
                  return expire;
 75
             }
 76
 77
             public void setExpire(Integer expire)
 78
 79
                 this.expire = expire;
 80
             }
 81
 82
             public String getPriKey()
 83
 84
                  return priKey;
 85
             }
 86
 87
             public void setPriKey(String priKey)
 88
 89
                 this.priKey = priKey;
 90
             }
 91
 92
             public String getPubKey()
 93
 94
                  return pubKey;
 95
 96
 97
             public void setPubKey(String pubKey)
 98
             {
 99
                  this.pubKey = pubKey;
100
101
         }
     }
102
```

## 第二十一步:编写工具类JwtTokenServerUtils

```
package com.example.tools_jwt.server.utils;
 2
 3
    import com.example.tools_jwt.entity.JwtUserInfo;

        private final AuthServerConfigurationProperties
28
    authServerConfigurationProperties;
29
30
        public JwtTokenServerUtils(AuthServerConfigurationProperties
    authServerConfigurationProperties)
       {
31
            this.authServerConfigurationProperties =
32
    authServerConfigurationProperties;
33
        }
34
35
36
        * 生成token
37
38
        * @param jwtInfo jwt信息
39
40
        * @param expire 到期时间
         * @return {@link Token}
41
         * @throws BizException 业务异常
42
43
44
        public Token generateUserToken(JwtUserInfo jwtInfo, Integer expire)
    throws BizException
45
            AuthServerConfigurationProperties.TokenInfo userTokenInfo =
46
    authServerConfigurationProperties.getUser();
47
            if (expire == null || expire <= 0)
```

```
48
49
                expire = userTokenInfo.getExpire();
50
51
            return JwtHelper.generateUserToken(jwtInfo,
    userTokenInfo.getPriKey(), expire);
52
        }
53
54
        /**
55
56
         * 解析token
57
58
         * @param token 令牌
59

         * @throws BizException 业务异常
60
61
        public JwtUserInfo getUserInfo(String token) throws BizException
62
63
            AuthServerConfigurationProperties.TokenInfo userTokenInfo =
64
    authServerConfigurationProperties.getUser();
            return JwtHelper.getJwtFromToken(token, userTokenInfo.getPubKey());
65
        }
66
    }
67
```

## 第二十二步:编写工具类AuthServerConfiguration

```
package com.example.tools_jwt.server.config;
2
3
   import com.example.tools_jwt.server.utils.JwtTokenServerUtils;
4
    import org.springframework.beans.factory.annotation.Autowired;
    org.springframework.boot.context.properties.EnableConfigurationProperties;
    import org.springframework.context.annotation.Bean;
6
7
8
    /**
9
    * Project name(项目名称): jwt_spring_boot_starter
10
     * Package(包名): com.example.tools_jwt.server.config
11
    * Class(类名): AuthServerConfiguration
12
     * Author(作者): mao
    * Author QQ: 1296193245
13
14
     * GitHub: https://github.com/maomao124/
15
    * Date(创建日期): 2022/11/3
    * Time(创建时间): 13:02
16
     * Version(版本): 1.0
17
18
     * Description(描述): 无
19
20
21
    @EnableConfigurationProperties(AuthServerConfigurationProperties.class)
22
    public class AuthServerConfiguration
23
    {
24
        @Bean
```

```
public JwtTokenServerUtils jwtTokenServerUtils(@Autowired
AuthServerConfigurationProperties authServerConfigurationProperties)

{
    return new JwtTokenServerUtils(authServerConfigurationProperties);
}

}
```

#### 第二十三步:编写注解EnableAuthServer

```
package com.example.tools_jwt.server;
 3
    import com.example.tools_jwt.server.config.AuthServerConfiguration;
    import org.springframework.context.annotation.Import;
4
 5
   import java.lang.annotation.*;
6
 7
8
    @Target(ElementType.TYPE)
    @Retention(RetentionPolicy.RUNTIME)
9
    @Documented
10
11
    @Inherited
    @Import(AuthServerConfiguration.class)
12
13
    public @interface EnableAuthServer
14
15
    /*
16
17
18
    配置文件示例:
19
20
21 authentication:
    user:
22
23
      # 过期时间
24
       expire: 1800
25
       # 私钥位置
26
       prikey: keys/pri.key
27
       # 公钥位置
       pubKey: keys/pub.key
28
29
     */
30
31
    }
32
```

# 使用starter

JwtTokenServerUtils主要是提供给权限服务的,类中包含生成jwt和解析jwt两个方法 JwtTokenClientUtils主要是提供给网关服务的,类中只有一个解析jwt的方法

需要注意的是tools-jwt并不是starter,所以如果只是在项目中引入他的maven坐标并不能直接使用其提供的工具类。需要在启动类上加入pd-tools-jwt模块中定义的注解@EnableAuthServer或者@EnableAuthClient。

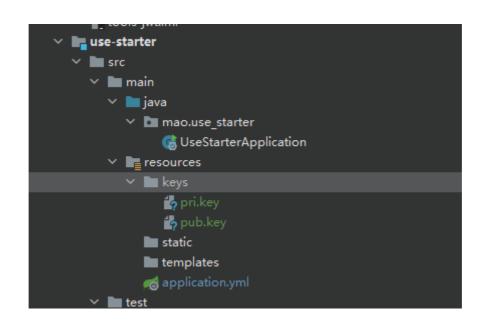

tools-jwt使用的签名算法为RS256,需要我们自己的应用来提供一对公钥和私钥,然后在application.yml中进行配置即可

## 第一步: 导入tools-jwt的依赖

```
<?xml version="1.0" encoding="UTF-8"?>
    project xmlns="http://maven.apache.org/POM/4.0.0"
    xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
 3
             xsi:schemaLocation="http://maven.apache.org/POM/4.0.0
    https://maven.apache.org/xsd/maven-4.0.0.xsd">
 4
        <modelversion>4.0.0</modelversion>
 5
 6
        <parent>
 7
            <artifactId>jwt_spring_boot_starter</artifactId>
 8
            <qroupId>mao
 9
            <version>0.0.1-SNAPSHOT</version>
10
        </parent>
11
12
        <artifactId>use-starter</artifactId>
        <version>0.0.1-SNAPSHOT</version>
13
14
        <name>use-starter</name>
15
        <description>use-starter</description>
        cproperties>
16
17
18
        </properties>
19
20
        <dependencies>
21
22
            <dependency>
23
                <groupId>org.springframework.boot</groupId>
                 <artifactId>spring-boot-starter-web</artifactId>
24
25
            </dependency>
26
27
            <dependency>
28
                <groupId>org.springframework.boot</groupId>
29
                <artifactId>spring-boot-starter-test</artifactId>
30
                <scope>test</scope>
31
            </dependency>
32
33
            <dependency>
34
                <groupId>mao</groupId>
                <artifactId>tools-jwt</artifactId>
35
```

```
36
                 <version>0.0.1-SNAPSHOT</version>
             </dependency>
37
38
        </dependencies>
39
40
        <build>
41
42
            <plugins>
                 <plugin>
43
                     <groupId>org.springframework.boot</groupId>
44
45
                     <artifactId>spring-boot-maven-plugin</artifactId>
46
                 </plugin>
47
             </plugins>
48
        </build>
49
50
    </project>
```

# 第二步:在资源路径下创建keys目录,将通过RSA算法生成的公钥和私钥复制到此目录下

第三步:编写application.yml文件

```
authentication:
1
2
     user:
3
       # 过期时间
4
       expire: 1800
5
       # 私钥位置
6
       prikey: keys/pri.key
7
       # 公钥位置
8
       pubKey: keys/pub.key
```

## 第四步:在启动类加注解@EnableAuthServer

```
package mao.use_starter;
 2
 3
    import com.example.tools_jwt.server.EnableAuthServer;
    import org.springframework.boot.SpringApplication;
 5
    import org.springframework.boot.autoconfigure.SpringBootApplication;
 6
 7
    @SpringBootApplication
    @EnableAuthServer
 8
 9
    public class UseStarterApplication
10
11
        public static void main(String[] args)
12
13
        {
14
            SpringApplication.run(UseStarterApplication.class, args);
15
        }
16
17
   }
```

## 第五步:编写UserController

```
1
    package mao.use_starter.controller;
 2
 3
    import com.example.tools_jwt.entity.JwtUserInfo;
    import com.example.tools_jwt.entity.Token;
 4
    import com.example.tools_jwt.exception.BizException;
 5
 6
    import com.example.tools_jwt.server.utils.JwtTokenServerUtils;
 7
    import org.slf4j.Logger;
    import org.slf4j.LoggerFactory;
    import org.springframework.beans.factory.annotation.Autowired;
    import org.springframework.web.bind.annotation.*;
10
11
12
```

```
13
    * Project name(项目名称): jwt_spring_boot_starter
14
     * Package(包名): mao.use_starter.controller
15
     * Class(类名): UserController
16
     * Author(作者): mao
17
    * Author QQ: 1296193245
18
     * GitHub: https://github.com/maomao124/
     * Date(创建日期): 2022/11/3
19
20
     * Time(创建时间): 13:24
21
     * Version(版本): 1.0
22
     * Description(描述): 无
23
24
25
    @RestController
    @RequestMapping("/user")
26
27
    public class UserController
28
29
30
        @Autowired
31
        private JwtTokenServerUtils jwtTokenServerUtils;
32
33
        private static final Logger log =
    LoggerFactory.getLogger(UserController.class);
34
        @GetMapping("/login")
35
36
        public Token login()
37
38
            JwtUserInfo jwtUserInfo = new JwtUserInfo();
            jwtUserInfo.setName("张三");
39
40
            jwtUserInfo.setOrgId(100001L);
41
            jwtUserInfo.setUserId(100000001L);
42
            jwtUserInfo.setAccount("张三");
43
            jwtUserInfo.setStationId(20001L);
44
            Token token = jwtTokenServerUtils.generateUserToken(jwtUserInfo,
    null);
45
            log.info(token.getToken());
46
            return token;
        }
47
48
        @GetMapping("/{token}")
49
50
        public boolean test(@PathVariable String token)
51
        {
52
            log.info(token);
53
54
            try
55
            {
                JwtUserInfo userInfo = jwtTokenServerUtils.getUserInfo(token);
56
57
                log.info(userInfo.toString());
58
                return true;
59
            }
            catch (BizException e)
60
61
                log.error(e.getMessage());
62
                return false;
63
            }
64
65
        }
    }
66
```

#### 第六步: 启动服务

```
1
 2
    /\\ / ___'_ _ _ _ _(_)_ _ _ _ _ \ \ \ \
 3
    (()\__|'_||'_|\'_\/_`|\\\
4
     \\/ __)||_)||||||(_|| ))))
    ' |___| .__|_| |_|_| |_\__, | / / / /
 6
7
    ======|_|======|__/=/_/_/
8
    :: Spring Boot ::
                                    (v2.7.1)
9
